## #17: Science English Poster Presentation

On March 16th, 2nd grade Science and Mathematics Course students had English poster presentations in the gymnasium at Kyuyo High School. They had worked hard to make English Posters based on their researches. In the Science English class, they worked on these posters. For this presentation, they practiced to introduce their researches in English to the public. Thanks to their hard work, all groups were able to have good presentations. 2nd grade International English Course students came to see their presentation and were impressed by both their researches and presentations.

In total, there were 36 groups of students. Those groups were divided into five research areas: physics, chemistry, biology, geometry and mathematics. Each group had their own themes. Every group member worked on their research for two years. During their research, they conducted their experiments to test their hypothesis and made observations about their experiments.

Even in Japanese, science terms are difficult to understand, however, they made their posters using those terms in English. It must have been very hard for them. Nevertheless, all of the students tried to do their best and completed their posters. At the poster presentation, thanks to their preparation and practice, their presentations were fabulous. We are sure that this experience will lead them to have a positive attitude toward learning.
